

Time / Cost Estimate

Time: Prep - 10 min / Active - 45 min

The prep time is used to make the borax solution and the ball jump. The active time includes the time required for each student to make two small balls (one latex and one PVA/cornstarch), for the class to make one large latex ball and for the students to test the finished balls using the ball jump.

Initial Cost: \$67.00

The estimated cost assumes that each student makes both a small latex ball and a small PVA/cornstarch ball, and that one large latex ball is made by the class. Alternatively, to minimize costs, students can work in groups of two or three, with each group assigned to make either a PVA/cornstarch ball or a latex ball. If choosing this alternative, the amount of materials required should be scaled down appropriately.
